

Figure 9: Nadir Mode Image of the Outaouais Region.

Similar to Fig. 8, in C-band VV-polarization, the image is shown in slant range presentation. This is quite visible in the urban development near nadir. It should be noted that incidence angle varies extremely quickly near the nadir edge in this mode. In this case, the incidence angles from 0 to 30° occupies only 10% of the swath.
