

APPENDIX A.

SPECIES INCLUDED IN THE "TABLE" WHICH WERE NOT GIVEN IN THE "CATALOGUE."

- ANCIENT MURRELET (*Synthliboramphus antiquus*). This replaces *S. wumizusume*, for which see the "Hypothetical List," Appendix B.
- BLUE GOOSE (*Chen caerulescens*). This was placed on the "Hypothetical List" of the *A. O. U. Code*, but Mr. RIDGWAY has since recognized it as a valid species in his *Manual*, and Dr. COUES has placed it in the third edition of the *Key*. It occurs between Hudson's Bay and the Rocky Mountains.
- WHITE-FACED GLOSSY IBIS (*Plegadis guarauna*). It is doubtless this species to which the bird taken by Mr. FANNIN off British Columbia should have been referred, as *autumnalis* is an eastern species that has not been taken on the Pacific coast.
- ALPINE THREE-TOED WOODPECKER (*Picoides americanus dorsalis*). I have not met with any record of the occurrence of this variety within Canadian territory, but Mr. RIDGWAY writes me that "it occurs throughout the entire breadth of British Columbia, in the Rocky Mountains."
- NIGHTHAWK (*Chordeiles virginianus sennetti*). This is a new subspecies, described by Dr. COUES in the *Auk* for January, 1888. The type was taken near Pembina, on the Canadian border. The habitat is given as: "Dakota to Texas, in any treeless country."
- BLACK-HEADED JAY (*Cyanocitta stelleri annectens*). It is probably this form, instead of *macrolopha*, which Mr. FANNIN has found in British Columbia.

APPENDIX B.

HYPOTHETICAL LIST.

- TEMMINCK'S MURRELET (*Synthliboramphus wumizusume*). Mr. FANNIN reports taking this Murrelet along the coast of British Columbia, but as it is doubtful if the species occurs on the American side of the Pacific, the birds captured by Mr. FANNIN should probably have been referred to *antiquus*.
- PALLAS'S MURRE (*Uria lomvia arra*). Occurs in the North Pacific, but there is no record of it having been taken within Canadian territory.
- RUFIOUS-CRESTED DUCK (*Netta rufina*). I have examined a skin of an example of this species that was said to have been shot on the shore of Nova Scotia, but it is possible the skin was imported.
- SNIPE (*Gallinago gallinago*). A European bird that has been taken in Greenland and Bermuda, but there is no record of its occurrence in Canada.
- GILDED FLICKER (*Colaptes chrysoides*). Mr. FANNIN reports taking this species in British Columbia, but as there is not any other record of its occurrence north of the extreme southern portion of California, it is possible that Mr. FANNIN'S birds should be referred to some other form.
- LONG-CRESTED JAY (*Cyanocitta stelleri macrolopha*). Mr. FANNIN thinks this a resident of British Columbia, but Mr. RIDGWAY writes me that "this must be an error, as it is entirely a Rocky Mountain form, whose British Columbian representative is *annectens*."
- MEXICAN RAVEN (*Corvus corax sinuatus*). This is probably the variety of the American Raven that occurs in the west, but its habitat has not yet been worked out.
