AN AYRSHIRE COW, THE PRODUCT OF A WISE SYSTEM OF BREEDING

Is it wise for one calf to have another calf? Many breeders of pure bred stock say "Yes." They breed their heifers to freshen when 20 to 26 months of age—mere calves. Sometimes these heifers make good cows and the breeder believes that his practice is justified. Prof. H. Barton believes that this practice is bad. "Lizzy Glen," here illustrated, is a product of Prof. Barton's system of breeding. She dropped her first calf at three years of age, and holds an official record of 9,116 lbs. of milk, testing four per cent. fat. Note the splendid development of this cow; also her feminine quality. Then read Prof. Barton's article, page three.
