## MAY MAKE YOUR OWN GOLD

If You Can Get Hold of Dr. Emmons' Secret.

## OUT OF MEXICAN DOLLARS

The Doctor Produced Argentaurum, Meaning "Gold-Silver."

While the product is not gold it is close to gold. It resembles the Yellow Metal that the United States Army Officer Took to the South. The Doctor is an Eccentric Man, But a Scientist of Repute, and is Now Giving Away His Secret.

New York, July 29.—If the tales told by Dr. Stephen H. Emmons be true, every man may make gold without having to dig it in the Klondike. All that is requisite is a Mexican silver dollar, a temperature that would make ice in St. Louis, any amount of impact, some work and much patience. The product will not be gold, but it is fondly hoped by its inventor that it will be saleable as gold and, to the mercenary, this should be equally as good.

Dr. Emmons has been the butt of some pleasantry on the part of the general public and of a good deal of frigidity on the part of scientists; but, since April 13, he has deposited in the United States Assay Office in this city a metal which may be real gold, but which he calls argentaurum—i. e., a combination of gold and silver and for which he has received \$20,000.

And all this, he declares, he made out of a few Mexican silver dollars.

**Great Discovery Perhaps?**

It is a great amount for the time and labor expended, but if he has not been "playing possum" with the assayers, there can be no doubt that he has made one of the greatest discoveries of the ages.

There is no transmutation or other alchemical process indulged in," says Dr. Emmons. He simply puts the Mexican silver dollar into an apparatus "which will prevent expansion and flow" and subjects the mass to heavy and continuous beating "under a condition of cold such as to prevent even a temporary rise of temperature when the blows are struck." That is as much as he will make public.

He does not pretend that if the Mexican dollar were of pure silver he could produce gold, but that with any silver dollar in which there is a trace of gold he can extract a metal which is equally as valuable as gold and which may be sold for gold. "To any one who doubts this he points to the record at the Assay Office, where his son sold the metal."

Dr. Emmons asserts with great positiveness that he has made a discovery.

## IN THE YUKON COUNTRY.

Continued from Page 1.

novel enterprise expect to get to work laying the wire in three weeks, and to have them laid six weeks later. The company does not intend to have any telegraph communication south from Juneau unless some of the larger companies construct a line north from Puget Sound.

**The Dog Train Mail Service.**

Ottawa, July 29.—J. J. McGee, Clerk of the Privy Council, left last evening for Canapoda with several Orders-in-Council regarding His Excellency's signature. Among them were the Yukon orders and a number of money orders in connection with the mail service to be signed before Saturday.

It seems probable that the road selected by the Government for the establishment of the dog train mail service to the Yukon during the winter and for the creation of the Yukon Canal to a point west of Teslin Lake, going up the White Pass, thence to Fort Reliance and then to Fort Cujo.

If the Government regulations regarding the collection of a royalty upon placer mining are not only used by the decision yesterday by the Yukon court, but if the Government will be made liable to the Yukon court for the collection of the royalty of his right to have any holding in the future.

**Pretty Sound Advice.**

London, July 29.—The "Emigrants' Information Office," issued urgent warnings to persons contemplating the migration to the Klondike, and pointing out that "Both parties are at a disadvantage, and the only way to avoid the expense, and to be only used by the decision yesterday by the Yukon court, but if the Government will be made liable to the Yukon court for the collection of the royalty of his right to have any holding in the future.

**View in Away Office.**

The present attitude of scientists is best illustrated by the position taken by Mr. Mason, a superintendent of the Assay Office, who says that as long as Dr. Emmons declines to disclose the process by which he has attained his results, all may feel at liberty to doubt his assertions. Mr. Mason said yesterday that the Doctor was a peculiar person, and his tale was interesting. A son of the Doctor had sold a certain metal at the Assay Office, and so far as he (Mason) knew, the office would continue to purchase anything which stood the tests demanded by law.

Emmons himself, naturally, is enthusiastic. He insists there is some gratification in having the world that jested at him come to him seriously and wonder how he did it, but he does not propose to disclose any of his secret that will injure him. He is a believer in the Mendeleef theory of periodicity, and the space, hitherto blank, between silver and gold in the periodical table of the elements.

**Had a Predecessor.**

In last May a Chicagoan named Brice applied for a patent on a process for the making of gold out of baser metals. The Director of the Mint made an investigation and reported adversely on the process. Brice used antimony largely, but it was found that a certain amount of gold was in the antimony. That was not making gold out of antimony.

Brice, it was thought, deceived himself, but Emmons is too good a scientist to be deceived. He is a member of the American Institute of Mining Engineers, and of the Society Internationale des Electriciens. He is the inventor of Emmons' process, which is a combination of gold and silver and for which he has received \$20,000.

And all this, he declares, he made out of a few Mexican silver dollars.
