June 18th, 1878.—J. K., æt. 8 years. Has had a distinct whoop 8–10 days following a catarrhal stage of 10 days. The paroxysms are very severe, and are followed by vomiting, epistaxis, etc., conjunctival vessels been ruptured, and the boy presents a horrible appearance, attacks come about every half hour at night. Ordered $\frac{1}{2}m$. ac. carbolic in glycerine and syrup every two hours.

June 21st.—No appreciable relief. Ordered to continue medicine, and to make use of the cloths wrung out of a solution of the acid as before.

June 24th.—Relieved a good deal; to continue. It gradually subsided from this date, and disappeared by July 1st.

The next two cases show a failure with this treatment.

June 26th, 1878.—J. K., æt. 4 years. Began the same treatment with carbolic acid, and continued its use till July 16th, together with the vapor as before.

July 18th.—No improvement whatever. Very weak, no appetite, and vomits continually.

Put him now on a mixture of nitric acid and belladonna, with some nitrate of potash and vin. ipecac.

July 21st.—Improving rapidly, and quite recovered by the end of the month.

T. K., brother of the preceding two cases, æt. 1 year and 9 months: Tried the carbolic acid treatment regularly for over two weeks; child getting worse; very weak and no appetite; spasms very severe.

I now put him on the same mixture as in the preceding case, with no apparent benefit.

After using various remedies I resorted to chloral hydrate, and this gave great relief and seemed to control the spasms. This was a very severe case, and I expected a fatal result, however, after a prolonged seige and a faithful use of the chloral hydrate, he eventually recovered.

Aug. 16th, '78.—Saw two children of Mr. P. Boy, æt. 4¹/₂ years, whooping since July 25th; girl, æt. 1¹/₂ years, whooping
