

where the damaging competition arises, where makers dare not assert their rights in demanding a supply, of wholesome and sound milk for fear that their opposition will take it and thereby they will lose patronage With fewer factories and the consequent lessened or more distant opposition, patrons could soon be brought to the understanding that it is to their lest interests to deliver at the factory a supply of milk that is sound. What is commonly termed the new.

a supply of milk that is sound.

What is commonly termed the newer districts of Ontario, Muskoka, Algoma and Manitoulin are not provided with factories or creameries. Parry Sound, Nipissing, and some of the counties are but sparsely supplied. In these sections home dairying flourishes. It is from these parts that comes the fine dairy butter, and the stuff that ought not to be called butter, that keeps down the price of finest creamery and keeps our dairying from rising to the high plane it might. might.

inght.

In the case of York, Ontario, Peel and Halton, it is reasonable to suppose that the scarcity of factories and creameries is owing to the large quantity of milk that must go to supply the demand of the city of Toronto. Oxford, probably the best and richest dairy county of the Province, is rationally supplied. Her 46 factories, three creameries and two condensing factories, within whose territory are 40,411 cows, account for much of the superior quality of the dairy products there manufactured.

Dairy and Stock Notes

Are you going to attend the Dairy-men's Convention to be held in Belle-ville? The date is Wednesday, Thurs-days and Friday, January 5th, 6th and 7th, 1910.

More money has been made swapping ideas than swapping horses. Try it this time.

"Can you do a little better?"
Said the milk can to the cow,
"For the feed bill is so heavy

We can scarcely pay it now." It is much more profitable to feed cows well, than to half starve eight. Be wise and only winter the best.

Winter is here. Are we ready? Have we made all the necessary provision for the comfort and welfare of our stock during the cold months of the year? The milkman of the future who suc-

ceeds will be the one who has clean feed for his cattle, clean stables, clean employees and clean containers for his milk. No after treatment of milk can take the place of cleanliness in the operations connected with its production and handling.

It may be you have been throwing your barnyard manure out under the eaves. Don't do it another winter, you can't afford to. Build a shed to store it in. Have it so the water will not find its way to the pile. The value of good manure is beyond estimate. Save it all.

In every farmhouse there should be a good book on the care and disease of farm stock. It should not be kept on the shelf all the time, but it should be studied until every farmer is competent to take good care of his stock.

A year ago I subscribed for Farm and Dairy through the young son of one of my neighbors, who was getting up a club. I have been very much interested and pleased with Farm and Dairy ever since. It is very practical and any farmer who reads it cannot fail to receive great benefits and instruction from its very interesting pages. I herewith enclose my renewal for another year.—Rolt. Newcombe, Huron Co., Ont.
