

Chillan Block⁸

The seismic survey started in 1993 is completed with a total of 220 km. The analysis of this information resulted in the recommendation of drilling an exploration well in "Ñiquen A" structure. This drilling is started in 1995.

ENAP's Projects in Magallanes

Assisted Recovery

Two wells located in the Bariloche sector tested the volcanic and the volcanic-sedimentary sequence. Both wells were abandoned as they did not show any commercial potential. The assistance was provided in the form of technical support and equipment. The assistance was provided in the form of technical support and equipment.

Springhill Exploration

The exploration activity of Springhill Project was directed to the sector of the Tierra del Fuego Island, mainly in the Sombroso, Viedma and Lago Merced. A well was drilled in the Sombroso area, but it was abandoned as it did not show any commercial potential.

Pre-Cretaceous Project

The most significant results in the Pre-Cretaceous Project were obtained in the Bariloche sector, where a well was drilled and tested. The results showed that the Bariloche sector has a high potential for oil and gas. The Bariloche sector has a high potential for oil and gas. The Bariloche sector has a high potential for oil and gas.
