creased in proportion as the soil has been cleared of its wood; but as the cultivated grounds are very inconsiderable, when compared with the waste lands of the province, we are not thence to suppose, that this ameliration of the climate is dependant solely on the progressive state of agricultural improvement. A variety of causes no doubt exist in the economy of nature, which tend to promote this important purpose. As associated with these causes, the visible revolutions which are taking place in the interior of the province, are not to be overlooked. Some of the small lakes have lost so great a portion of their water, that they appear to be slowly passing into a state of desiccation. Others are gradually filling up with the vast quantities of soil and gravel, which are carried down from elevated situations by their numerous rivers. Extensive marshes are now found in those places which were formerly occupied by lakes. These marshes again are undergoing transformation. From the accumulated mass of their decayed pro-
