

sub-species. Song, *we che, we che, we che de de.*

216. *Dendroica palmarum hypochrysea*, Yellow Palm Warbler. This is an abundant summer resident, in the Mer Bleue only so far as is known, but probably also in other similar localities in the district. I have taken them June 3rd, 1904; June 13th, 1909; August 5th, 1910, when the young were full-grown. They probably arrive here before *palmarum*, as a nest with four eggs was found as early as May 23rd (1908). The song is like that of the Chipping Sparrow.

217. *Seiurus aurocapillus*, Oven-bird. A common migrant and summer resident. In deciduous woods, as Beechwood, Beaver Meadow, etc., one or two may nearly always be heard. Extreme dates of stay: May 6th to September 19th.

218. *Seiurus noveboracensis*, Water-Thrush. A moderately common migrant and summer resident. At the pools in the waterfront, west of Eddy's mills, Hull, several pairs may be seen and heard throughout the summer, as also on the eastern side of Beaver Meadow. Extreme dates: May 8th to September 6th. One of their loud, liquid songs may be represented, *whilla whit-cher, watch watch watch watch.*

219. *Oporornis agilis*, Connecticut Warbler. A rare migrant. I have seen it twice at a range of 5-10 feet, at Rockcliffe Park May 5th, 1906, and at High Falls, Quebec, October 3rd, 1907.

220. *Oporornis philadelphia*, Mourning Warbler. A rather rare migrant and breeder. It is a swamp-loving species; where cedar, spruce and alder bushes, especially the last, are found growing in or near water, it must be looked for. A pair usually breeds in each of the following places: alders near Slattery's slaughter house, Ottawa East; Dow's Swamp; alder fringe in Beaver Meadow, and west of Blueberry Point. Time of stay: May 19th to September 9th.

221. *Geothlypis trichas*, Maryland Yellow-throat. A very common migrant and summer resident. In willow, alder and cat-tail swamps, down to the smallest, it is usually to be seen. Its call, *whitchedy, whitchedy, whitchedy*, announces its presence long before one sees the bird. It has also quite a repertoire of other songs. By June 7th its nest with three eggs has been found. It first arrives May 5th; our locally breeding birds go by August 1st, but their place is soon taken by migrants from farther north, of which the last is seen September 25th.

222. *Wilsonia pusilla*, Wilson's Warbler. A moderately common migrant only, not breeder, although it may yet be found as such. It is one of the later comers in May, not arriving before the 15th. As late as June 2nd, 1907, they were abundant at Ottawa East. The last have been seen September 15th. The song, rarely heard, is, *tsit sit sit dreer idididee.*
