FARM AND FIRESIDE.

Timely Hints Useful to the Farmer

cows are kept in winter, and the farmer does not think it worth while to provide many special facilities for dairying, considerable art is required for making a uniform article of good butter; as it seldom happens that a sufficient quantity of cream is gathered to admit of its being churned every day. Not keeping cream over from one day to another in good condition is a very nice operation indeed, the cream is so apt to acquire a disagreeable taste and smell, either through its wondeful readiness in absorbing all foreigns odors, or and flavor, and the best hotels, restaursome extent, I would make a point of always uniform. But he encourages us churning at least twice a week, even if the quantity of milk were so small that and his wife given the facilities of the the family had to be deprived of it for one day in order to be able to mix enough as fine or finer butter. In summer, ice is cream with the milk to make a good of course needed for this; but in winter, churning. The household will not object when even an open porch makes the best

Some years ago I visited an amateur lairyman who milked perhaps a dozen market. So let the progressive farmer's cows, and had churning done only twice a week, but the butter made was the very nicest I ever tasted, perfectly sweet and fresh, of a firm and grainy consistency, the other little details so essential to sucand a uniform gold yellow. But to insure this perfection he took the greatest fault any more—that is, if her family possible care that neither the milk or leave any surplus for their delectation. cream should have any opportunity for absorbing impurities from the time the milk was drawn till the butter was taken from the churn. "Impurities," in this sense, does not necessarily mean noxious gases, but the tumes or exhalations arising from any substance whose flavor we would object to having incorporated with our butter. If the cream jar stands in the kitchen, for instance, absorbing day after day the various exhalations arising from the cooking-stove, the butter, while we may not exactly detect in it the flavor of Next door above Mr. Hodge's store, boiled cabbage and stewed onions, will be very far from possessing that sweet, pure taste it otherwise would. Or if the cream be kept in a cellar that is damp or ill ventilated, or where winter vegetables are stored, some naturally in process of decay, the cream will be sure to acquire an old,

few days in payment.

musty taste that will naturally be intensifled in the butter. Nor should milk or cream intended for churning ever be allowed to freeze: freezing causes some chemical change to take place which lessens the quantity of butter as well as makes churning more difficult. Keeping the cream warm all the time before it is churned is quite as great a mistake, let it stand in some cool, clean place away from the fire until the morning before it is to be churned, and then, all the cream having been collected and some milk added to it if necessary, bring it into a warm room where it will heat gradually to about 70°, never higher in any event. Several times during the day the mass should be stirred, dipped up and down, and thus aerated so that all will be thoroughly mixed and will "turn together," or as the scientific dairyman would say, "ripen uniformly." If, at night, the cream is not sour enough to make it turn betimes next morning, then mix a little buttermilk with it. This will not injure the quality of the butter; that is, if the buttermilk was made from cream When I say I cure I do not mean merely to stop them for a time and then have them return again, I mean a radical cure. I have made the disease of FITS, EPILEPSY or FALLING SICKNESS a life-long study. I warrant my remedy to cure the worse cases. Because others have failed is no reason for not now receiving a cure. Fend at once for a treatise and a Free Bottle of my infallible remedy. Give EXPRESS and PO-T-OFICE.
H. C. HOOT, M. C., 186 ADELAIDE ST., WEST, TORONTO, ONT. When I say I cure I do not mean merely to stop will be ready for churning long before that, when it acquires the consistency of buttermilk, showing on the spoon a

> wise excellent housekeepers have I heard say - "Oh, that cream was turned early this morning, or yesterday perhaps, but I did not think it would hurt to stand." In winter, the cream is best churned at a temperature of 64°. And right here let idea what a help it will be to you; it is such a comfort to know exactly what you are doing and then to go ahead without any infantry soldiers. misgivings. Even by contact, it is impossible to judge temperature correctly. In summer, we say the water from a well is cold; while in winter we pronounce the same water warm. Churn with a mod-

grainy appearance — what the dairymen

call loppered. If allowed to stand after

this, the acid in the cream destroys the

butter fat, and in consequence the yield of

butter is lessened. Yet, how many other-

nometer does good service. When it indicates too low a temperature, pour in a small quantity of hot water, trying the temperature until it again registers 64° Thus it brings such a saving of time and labor. Why, actually, I have seen one of my neighbors churn six hours on a stretch, and still that butter wouldn't come! Many persons have a great antipathy to putting hot water in the churn, but if the milk be gently agitated while the water is poured in, and barely enough is used to get the temperature right, there is no danger whatever. I have seen just as firm yellow butter made when hot water was used as without it.

Again, others make the mistake of churning too long after the butter comes; the coils of this breaks the delicate little granules inthe fatal ser- to which the butter comes first crystalunder the ef- the butter for a few minutes with a slow, worry, etc. Rouse yourself. WONDERFUL MECHANISM. A Piece of Machinery that Describes the Crucifizion.

Architecture and Building (New York). - Herman Jacobs, a carpenter of Bunzlagi, russia, has been credited with construct ing a wonderful piece of mechanism representing in several successive scenes the passion of the Savior. All the actors in the grand impressive drama are carved from wood, and are each about six inches in height. The machinery runs by clockwork, and enacts the various parts three times at each winding. The panorama first unfolded is a beautiful garden, with the figure of Jesus kneeling in prayer under one of the trees, figures of the three sleeping apostles being plainly discernable in the distance. As the machinery warms up, the wheel and the figures move more rapidly, quickly unfolding the last scenes in the earthly career of Jesus, the last supper, the betrayal, the remorseful look which comes over the face of Judas when he first realizes the extent of his crime, the examination of Jesus before Caiphas, the dialogue between Pilate and the Jews-all flit before the gaze in a manner so astonishingly life-like and real as to make one almost believe himself at Calvary. After the sentence has been pronounced a figure of Jesus with the cross appears. The cross is mechanically erected, while the little figures busy themselves in binding the figure to be nailed upon it. Ladders are run up to the arms of the cross, a little figure slips quietly over the rungs, then there is a sound of hammers as two figures hold the one that is being nailed to the cross by the two figures on ladders. At last when all is thought to be finished a figure on horseback slides across the platform. draws his sword, and thrusts it into the side of the figure on the cross. The last scene represents Jesus in the sepulchre mechanism I have ever seen. The feelings which cannot be felt at a mere

Peck, E. 15th street, New York city, visited Canada last year, and had the good fortune to pick up something which not only suited her, but her neighbors also. Writing the manufacturer of Nerviline she says: - "I bought three bottles of Nerviline while in Canada and treated my neighbors to some of it, and all think it the best medicine for internal or external pain they have ever used."

It is a remarkable fact that the bigger a nearly her head comes to solving the
