

The Noxon Platform Frame of Steel

Is formed of a solid continuous bar at the back running from a solid connection with the gear frame, to a connection with the cutter bar at its outer end, making a **continuous outline of steel**, perfect in its disposition and unrivalled as to strength. For low cutting, especially on uneven or lumpy ground, **the right kind of a cutter bar is of the greatest importance.**

What more is to be desired about this Frame of Steel. Notice particularly how few joints there are and how strong they are made. No weak joints or twisting about it.
GOOD FOR A LIFETIME.

The Noxon Steel Finger Bar

The usual shape of Cutter Bar on other Binder. Just right to clog with dirt and stones.

Just notice how close this Cutter Bar can get to the ground. No grain lying too flat for it to pick up. Slides over all dirt and stones and will not clog.
