Males and
females, all ages. Also one
Ayrshire bull, 2 months old, for sale. Prices
reasonable. ALEX. McKINNEY, R.R. No. 1,
Erin, Ont. Erin, C. P. R., Cheltenham, G. T. R.

**Questions and Answers.
Veterinary.****Umbilical Hernia.**

At castrating time one of my pigs
(now 4 months old) appeared to have
a rupture near the sheath. Now it is
about the size of my two fists. Some
of the other males and one female are
getting the same way. N. B.

Ans.—This is navel or umbilical
rupture. We can give no cause for it.
The umbilical opening fails to close,
but we cannot say why. An operation
by a veterinarian will, in most cases
effect a cure. In many cases the animal
fattens and becomes ready for the
butcher without treatment. When the
hernia becomes as large as you state,
it should be treated. A truss could
be arranged to support the rupture,
but probably it would be wise to slaughter
those that are badly affected. V.

Lumps on Legs.

Last winter I noticed two lumps on
my pregnant heifers hind leg. After
a few weeks a few more lumps formed
on the leg. I was told that when she
was turned out on grass, they would
disappear, but the condition has become
worse. Now there is a perfect mass of
lumps, about the size of marbles. The
leg, near the foot is badly swollen, and
there is a lump the size of a hen's egg
on the fleshy part of the hip. I poulticed
this and it broke and a little matter
escaped. I noticed two very small
lumps on the front leg to-day. R. J. L.

Ans.—These lumps are either tumors
or tubercular nodules. Some cattle are
predisposed to the growth of tumors
on their legs. We cannot explain why.
When the growths are of a fibrous
nature they do no harm. Local ap-
plications do no good. They can be
carefully dissected out and the wounds
then treated as ordinary wounds. Of
course, where the growths are so numer-
ous on your heifer, the operation of dis-
section would leave a very sore leg.
In rare cases we find a form of tuber-
culosis in which the nodules or tumors
appear in the muscles and under the
skin on the legs. The fact that the large
growth burst and discharged a little
rather indicates this trouble. A bacteri-
ologist would be able to tell, by ex-
amining some of the discharge, whether
or not it is tubercular. A veterinarian
might be able to tell by cutting out and
examining the large tumor, but the
surest means of diagnosis is to have
her tested with tuberculin. V.

Miscellaneous.**Weighing Milk.**

Re the article on weighing and testing
milk in issue of June 1. What kind
of scales are ordinarily used in the
stables? Can you tell me where I
could purchase a spring balance or
other scale?

2. Explain the use of preservative
tablets which are used in warm weather
when milk or cream is not tested daily. A. B.

Ans.—1. The circular dial spring-
balance scale which weighs to a tenth of
a pound is generally used, although
the ordinary spring balance is satis-
factory for weighing the milk. If
scales cannot be purchased locally write
one of the dairy supply houses for a
catalogue. Richardson's of St. Mary's, or
Drummonds of Toronto, would no doubt
mail one on request.

2. The preservative commonly used
is three parts bichromate of potash to
one of corrosive sublimate. This material
is poisonous, but it turns the milk yellow
so no one is apt to drink it. Put about
as much of this powder as can be lifted
on a ten cent piece into each sample
bottle. This will keep the sample good
for from two to four weeks according to
the weather. If the sample of milk or
cream does not appear to be keeping
add a little more preservative. The
preservative tablets are more convenient
to use and are equally as effective as the
powder. The sample of milk or cream is
kept from curdling so that a satisfactory
test can be made monthly instead of
daily if it is so desired.

Increased Production!

The Government call to every loyal Canadian
engaged in Agriculture is for "Increased Pro-
duction"—an important factor in
the present titanic struggle. With
the call to arms never was labor
so scarce. Labor-saving devices
have saved the day in many cases.
Take Dairying: The Sharples Milker
does the work of milking in one-
third the time at less cost. Any
man that owns 15 cows or more
should get one. The fact that one
man can milk 30 cows an hour is
worth thinking over. But the one
thing that places the

**SHARPLES MILKER**

head and shoulders above any other is the patented "Upward Squeeze,"
which eliminates any possibility of inflamed teats and soothes the cow
during milking. The Sharples Milker is a vital factor in the production of
Clean Milk. The milk flows from teats to sealed silver buckets through
rubber tubes. No stable dust, no stable air, no hands can touch it. Clean
milk means more dairy dollars. Increased milk production follows its use
in almost every case. Over 300,000 cows milked twice daily by the
Sharples is abundant proof of satisfactory service. Our free booklet,
"Dairying for Dollars Without Drudgery," contains valuable dairy hints.

"Does Its Bit" In Cream Saving

—no matter how fast or how slow you turn the crank—gets all the cream
at any speed. You know it is not humanly possible to operate a separa-
tor at the same speed every time. Then get a

**SHARPLES
SUCTION-FEED
CREAM SEPARATOR**

It insures your dairy profits and increases production.
Perfectly even cream every time, too—that means
top prices. Easy to clean—no discs. Easy to turn—
low speed. And freedom to turn at any convenient
speed. Low supply tank means easy filling. Write
for free book, "Velvet" for Dairymen. Address De-
partment 78.

We make a splendid line of Double-Ignition Gasoline
Engines, 2½ to 9 horse power. Fully guaranteed.
