Parker F. Reagh, Prince Albert, Wilmot, Co. Annapolis—Jersey Bull.

For the Journal of Agriculture.

APPLE TREES AND APPLES.

MR. EDITOR,—I have somewhat to say upon this subject that may be of benefit or interest to a number of your readers. One of your correspondents states that the southern slope of the Cobequid Mountains is not a fruit district. I believe the only reason why this is so is because the farmers in that district do not make due effort to raise fruit. I cannot imagine there is anything in soil or climate against raising fruit—apples, at any rate—on either slope, or on any part of the Cobequid Mountains, or any other part of this Province. I once thought differently, in common with almost every other person in the Province. But then, thirty years ago, people merely planted trees in the ground, wherever the ground might happen to be, or whatever it might happen to consist of. Then, the most of our fruit came from Boston, and what few shakings we did produce the pigs would scarcely eat.

But in regard to the slopes of the Cobequid Mountains,—here we have a series of somewhat steep, rounded spurs, rather inaccessible for all farming purposes—rounded, sloping promontories, which the Romans in military operations termed *colla*, from their resemblance rather to the necks of oxen than anything else. This south slope consists of a close grouping of rocks, that contain in astonishing abundance all, or nearly all, the elements of fertility. I cannot conceive that the world will last long enough for any impression to be made, in the ordinary course of farming, upon this boundless mass of manurial material, in fact I have been at different times struck with the belief that nowhere in Eastern America do we find such unlimited
