

The Dietetic Treatment of Typhoid Fever presents many difficulties that are entirely overcome by the use of

Lacto-Globulin

Here are two typical cases reported by Dr. C.——, Montreal:

(1) Man aged 40, severe attack typhoid; hemorrhage appeared third week. Gradually grew weaker and took no nourishment; no improvement with all recognized methods of treatment. Put patient on Lacto-Globulin, temperature decreased, and marked improvement in nutrition; patient gained weight. I am convinced that with no other treatment but Lacto-Globulin could such results have been obtained.

(2) Boy aged 12, severe attack typhoid fever; on being called, prescribed Lacto-Globulin; patient lost no weight, and temperature never went higher than 102°. This temperature at first visit was 104°. This remarkable fall of temperature was due entirely to the sole use of Lacto-Globulin. Patient made an uninterrupted recovery in three weeks.

Similar results are always obtained by using this Food.
