

12. Key precursors which may possess the following characteristics:

- (i) it may react with other chemicals to give, within a short time, a high yield of a toxic chemical defined as a chemical weapon;
- (ii) the reaction may be carried out in such a manner that the toxic product is readily available for military use; and
- (iii) key precursors which have little or no use except for chemical weapons purposes.

The order in which these factors are listed does not indicate any priority.
