| <b>Chap. I. The Skeleton.</b> —The meaning of anatomy and physiology. Cells and protoplasm. Quality of bone. The divisions of the skeleton. A reason for docking. The importance of a well sprung rib. The bones and joints of the limbs. Splint bones and splints. Lateral cartilages and sidebones. The hooks and hock. Location of joints in animals. The height of a horse.....                                                                                                                                                                     | 1-22  |
| <b>Chap. II. The Muscles and their Work.</b> —Muscular and connective tissue. The grain of meat. Quality of muscle. Tendons or sinews. Certain muscles and their work. Suspensory ligaments. Joint oil or synovia and its uses.....                                                                                                                                                                                                                                                                                                                     | 23-31 |
| <b>Chap. III. The Digestive System.</b> —Prehension and mastication. Secretion and the digestive fluids. Saliva, gastric juice, bile, pancreatic juice. The taking of food into the tissues, termed absorption. Mucous and serous membranes. The teeth and their arrangement. Telling the ages of horses, cattle and sheep. The stomach of the horse, pig, sheep and ox. Types of stomachs. Time required for digestion. The small intestines and their work. The liver and its secretion—bile. The pancreas and its fluid. Chyle and the lacteals..... | 32-58 |
| <b>Chap. IV. Excretion.</b> —The expulsion of waste products. The large intestines. The kidneys and urine. Reflex action. The secretions of the skin. Sweat and grooming. The sebaceous secretion. Respired air. Organs of breathing. Breaching and choking. The larynx and roaring. The lungs and their construction.....                                                                                                                                                                                                                              | 59-69 |
| <b>Chap. V. The Process of Breeding.</b> —Reproduction and the organs involved. Heat, its signs and frequency. Periods of gestation. Number of females to the male. Age when to breed. Essentials in mating. The digestive and reproductive organs of poultry. Mating of poultry.....                                                                                                                                                                                                                                                                   | 70-83 |
