

Genitalia.—Female segment moderately long, posterior margin slightly concave, the median fifth excavated, the excavation gradually or abruptly narrowing to a slit as in *fraternus*, posterior disc with a quadrangular black area.

Described from five females from Estero, Florida, received from Mr. Van Duzee. This may possibly represent a distinct species, the size and colour are always slightly variable in this group and are not specific. There appears, however, to be quite a difference in genitalia, although both are of the same general type and both slightly variable. A longer series will be necessary to definitely determine whether this is an extreme form adapted to some slightly different faunal region or a distinct species.

*Deltocephalus micarius*, n. sp.

Resembling *Weedii*, but larger and with longer and more flaring elytra. Brownish straw, with five stripes on pronotum, and nervures light. Length, 3.5 mm.

Vertex flat, almost twice as long at apex as against eye, right-angled in front, the margins straight, the apex not at all produced as it is in *Weedii* and *compactus*, face as in *Weedii*, pronotum with the anterior margin strongly arched, elytra long and narrow, inclined to be flaring posteriorly, extending considerably beyond the abdomen in both sexes. Venation similar to that of *Weedii*, the outer claval area strongly reticulated with central anteapical cell elongated, constricted through the median portion and usually divided by a broad union of the nervures for some distance.

Colour.—Pale brownish straw, the vertex washed with orange, the margins and median line narrowly light, a pair of minute spots just back of the ivory apex and a larger pair midway to the ocelli black. Pronotum with traces of olive on the disc and five narrow light stripes. Elytral nervures light, slightly margined with brownish, which shade into fuscous against the first cross nervure to claval suture, again on the first cross nervure between the sectors and almost filling the apical cells, face fuscous brown, with short arcs on front and concentric markings on genæ light.

Genitalia.—Female segment short, the lateral angles rounding into the posterior margin, which is nearly straight except for a small median tooth. Male valve small, short, plates small, the outer margin concavely narrowing to the rather broad, truncate tips.

Described from two pairs from Seven Oaks, and Sanford, Florida, collected and sent by E. P. Van Duzee. In head characters this species
