PLAIN AND FANCY PRINTING  
OF ALL KINDS,  
Promptly Executed at Lowest Rates.  
ADVERTISEMENTS  
Inserted at very Lowest Rates.  
E. WOODWORTH, Manager.

**FARM AND HOUSEHOLD.**  
—Frog farming is to be tried at Hempstead, Long Island.  
—The poultry crop in North Carolina is said to be worth \$2,800,000.  
—A Canadian forester urges the planting of "maple-sugar orchards" on hillsides.  
—The first complete sewing-machine was patented by Elias Howe, Jr., 1846.  
—Canada exported last year \$9,705,817 worth of butter, and \$6,351,870 worth of cheese.  
—Many Louisiana planters, discouraged by the low price of sugar, talk of changing to rice.  
—The royalty yielded to the so-called inventor of barbs on wire fences is said to be \$10,000 a month.  
—It is said that the beet-sugar factory at Alvarado, Cal., pays its stockholders 80 per cent. on the capital invested.  
—Nova Scotia has set a noble example by sending a man to jail three months for lying in a horse trade.  
—Dr. J. H. Hanford, food reformer, remarks that with a reasonable abstinence, a reduced quantity of the "heaters," such as butter, sugar, starch, etc., and free exercise in open air, most of the "supposed evils"—result of over-eating—would be promptly cured.  
—At certain Western farms last fall, and later in villages, "Cinnamon Beans" were sold—a variety of common bean smeared with oil of cinnamon. The people were told they could raise their own cinnamon trees, and strange to say thousands believed the story and paid 5 cents apiece for the "seed."  
—There are 610 silos in England, Wales, and Scotland, of which 514 are in England, 36 in Wales, and 60 in Scotland. Norfolk has the greatest number. The largest total capacity of silos is found in Norfolk, with 142,403 cubic feet, followed by Devon with 115,710 cubic feet, and by York with 114,367 cubic feet.  
—Lime slaked with a solution of salt in water and then properly thinned with skim milk from which all the cream has been taken makes a permanent whitewash for outdoor work, and, it is said, renders the wood incombustible. It is an excellent wash for preserving wood and for all farm purposes.  
—Farmers in the south-west, who held back their grain early in the season, are selling freely, the weather being favorable to large marketings in the country. Wheat is selling at northern Minnesota and Dakota faster than ever before. In fact, the elevators at Duluth are overflowing with wheat. Farmers are forced to sell at whatever price they can get, to liquidate personal indebtedness.  
**The Dairying Industry.**  
The following extracts are taken from a report of the eighth annual convention of the New York State Dairyman's Association:  
Professor I. P. Roberts favored high but judicious feeding; feed weeding out the poorer cows; showed by figures derived from his own experience that, estimating milk at one cent a pound, there is a difference between the value of the product of one of his poorest and one of his best cows of over \$50 a year. It pays to give rich food, not only in the increased and better quality of the product, but in the extra richness of the manure. He found by analysis and careful estimates that the accumulations of sixteen horses and thirty-four cows for six months were as valuable for manure purposes as \$1,000 worth of commercial fertilizer. The manure was collected in a covered barnyard, and heves exposed to rain and atmospheric action, which deprive the manure produced on most farms of a large share of its value.  
Mr. B. D. Gilbert presented a commercial view. The exports from this continent since May 1 to December 1 were 180,272,275 pounds of cheese. Of this, 534 per cent. was shipped from New York, 42 per cent. from Montreal, and the rest from other points. The receipts in New York during the same period were 2,024,914 boxes, which is 72,778 boxes less than for the same interval last year. The export of butter from January 1 to December 1 was 14,618,585 pounds against 17,429,137 pounds last year. Canada has experienced a similar decline in exports of butter. The home market is willing to pay better prices than the foreign. England gave cheaper butter from the Continent. The use of the skimmer in the cheese factory has done great damage during the season, and brought cheese into disrepute abroad. In addition to this, it has proved to be a losing business in dollars and cents. Whole-milk cheese factories have netted their patrons more milk than have those that made both butter and cheese.  
Scott's Emulsion of Pure Cod Liver Oil, with Hypophosphites. Has all the virtues of the two most powerful remedies. Made into a form that is very palatable and acceptable to the most sensitive stomach, and is without doubt, unequalled, as a combined food and remedy for lung troubles, and wasting conditions.

VOL. 15.—NO. 35. SACKVILLE, N. B., THURSDAY, JANUARY 15, 1885. WHOLE NO. 764.

**UP THE NILE.**  
Difficulties of the Expedition.—Adventures of the Voyageurs.—Shooting a Cataract.  
The "brigade of reporters" who accompany the Wolseley Expedition up the Nile are sending home some very interesting letters at present. The correspondent of the London Standard, writing from Dal on the 13th November, says: The pioneer boats of the Nile Expedition have at length reached this point. The navigation of the Bahr-el-Jel, the first and crucial stage of their long journey, has been completed, and it is possible to form an estimate of the task Lord Wolseley has set his army to carry through. Some time ago I wrote that should the Nile route prove practicable and our troops succeed in reaching the heart of the Soudan by water, one of the greatest military feats of modern times would be accomplished. I am now becoming the opinion of all who accompany the Expedition. So far, it is clear they were wrong who prognosticated complete failure; but on the other hand, it is also evident that those who came from England prepared to ascend the Nile in slight built whale boats, heavily laden with troops and stores, and not anticipating any serious difficulties, were equally mistaken.  
The work of the boatmen is thus graphically described by Major Derwent: "We were to ascend the Nile a good breakfast in the morning before starting. From seven to noon they toiled at the oars and ropes, and then passed an hour for dinner, resuming at one, and not ceasing work until dark. When sailing up the river a month ago in a Dongola boat, I anticipated that not at the regular oarsmen would be the most formidable obstacles to the progress of the expedition be found, but on the names of the boatmen. Such is proved to be the case. Unloading the boats and portaging their contents on camels and hauling up even the Semah Cataract, with the assistance of concentrated labor, proved comparatively easy. But with a small rapid is concentrated, with the current too strong for the boats to contend against with sail and oar, then have the men to work and work hard. First the foramen voyageur proceeds along the banks to prospect. The wood incombustible. It is an excellent wash for preserving wood and for all farm purposes.  
—Farmers in the south-west, who held back their grain early in the season, are selling freely, the weather being favorable to large marketings in the country. Wheat is selling at northern Minnesota and Dakota faster than ever before. In fact, the elevators at Duluth are overflowing with wheat. In addition to this, it has proved to be a losing business in dollars and cents. Whole-milk cheese factories have netted their patrons more milk than have those that made both butter and cheese.  
Scott's Emulsion of Pure Cod Liver Oil, with Hypophosphites. Has all the virtues of the two most powerful remedies. Made into a form that is very palatable and acceptable to the most sensitive stomach, and is without doubt, unequalled, as a combined food and remedy for lung troubles, and wasting conditions.

**Baking Bread.**  
The baker's old-fashioned method of testing the temperature of his oven is instructive. He throws flour on the floor. If it takes without taking fire, the heat is considered sufficient. It might be supposed that this is too high a temperature, as the object is to cook the flour, not to burn it. But we must remember that the flour which has been prepared for baking is mixed with water, and the evaporation of this water will materially lower the temperature of the dough itself. Besides this, we must bear in mind that the object is to be attained. A hard shell or crust has to be formed, which will be exchanged for the merrily prattle of the carbonic acid bubbles by the boiling of the point of water. In spite of this high outside temperature, that of the inner part of the loaf is kept down a little above 212° by the evaporation of the water contained in the bread; the escape of this vapor and the expansion of the carbonic acid bubbles by heat increasing the porosity of the loaf. The outside being heated considerably above the temperature of the inner part, this variation produces the difference between the crust and the soft part. The action of the high temperature in directly converting some of the starch into dextrin will be understood from what I have already stated, and also the partial conversion of starch into caramel, which was described in Nos. 13 and 14 of this series. Thus we have in the crust an excess of dextrin as compared with the crumb, and the addition of a variable quantity of caramel. In lightly baked bread, with a crust of uniform pale yellow color, the conversion of the dextrin into caramel has barely commenced, and the gummy character of the dextrin coating is well displayed. Some such bread, especially the long staves of life common in France, appear as though they had been baked in a furnace, and their crust is partially soluble in water.  
This explains the apparent paradox that hard crust, or dry loaf, is more easily digested than the soft crumb. The hard crust, which is the more hydrated of the gluten and the starch, and such degree of dextrin formation as was due to the action of the diastase of the grain during the preliminary period of "rising,"—the "The Chemistry of Cookery," by W. MATTIEU WILLIAMS, in Popular Science Monthly, The Mimic Ocean.

sep 17 Agent.

**Pale, Poor, Puny, & Pallid.**  
Considering all the ills that attack little children, it is a wonder that any of the poor little youngsters live to grow up. There are children who are really objects of pity. They are bloodless. Their cheeks are thin and pinched; their eyes are hollow; and their skin is tightly drawn over their foreheads. There is nothing hearty about them. They do not enjoy their lives. They are suffering from the debility that leads to marasmus. Poor things!  
Do a good deal for the pale, poor, puny, pallid child. Hand its mother a bottle of the Shaker Blood Syrup. Here is life even for the most delicate, the most debilitated; for the child almost given up for dead. Pure blood is what the child needs, to bring it up. The little digestive apparatus will recover. The pale cheeks will fill out. The weary gaze of the child will be exchanged for the merry prattle of infantile gladness. Your druggist will tell you what wonders the Shaker Blood Syrup has done for very sick children.  
—Ayer's Hair Vigor improves the beauty of the hair and promotes its growth. It imparts an attractive appearance, a delightful and lasting perfume. While it stimulates the roots, cleanses the scalp, and adds elegance to luxuriance, its effects are enduring; and thus it proves itself to be the best and cheapest article for toilet use.
