

I have ever seen. Heretofore the species has not been recorded anywhere nearly so far north-west.

CIRROEDIA PAMPINA Gn., August 27 ; one specimen of the normal form. Mr. F. H. Wolley Dod has taken at Calgary a series of a remarkably pale form of this species which gives a strange impression and seemed, at first, to indicate a good species. More abundant material, however, proved it to be a local and by no means constant variety, intergrading with the typical form.

DRASTERIA DISTINCTA Neum., May 26 (2) ; June 3 (1) ; June 4 (1) ; June 20 (1). This interesting little form seems to have its home in this region. It has been referred as a variety of *crassiuscula*, and may eventually prove to be such. I have a specimen of *crassiuscula* from Long Island that would easily pass for *distincta*, except that it lacks that the peculiar livid or bluish tinge that allies *distincta* to *aerulea*. The latter species is recorded from California, but I have it also from Oregon, Washington, Vancouver and British Columbia. Calgary seems to be the point of meeting between *crassiuscula* and *aerulea*, and *distincta* appears to be intermediate between the two. Larger collections to the east and to the west of this locality will prove of great interest.

PHILOMETRA GAOSALIS Wlk., August 4 ; one male of normal type. The species is here close to the recorded western limit of its range.
