WHY NOT A COBALT COIN?

It may be permissible to point out that a still further avenue is open for the employment of cobalt. The 5-cent piece is the least desirable of our Canadian silver coins, mainly because of its smallness in size and the consequent difficulty in handling it, and especially of distinguishing it from the 10-cent piece without ocular examination. Why should it not be replaced by a coin made of pure cobalt, intermediate in size between the 10-cent piece and the 25-cent piece? Such a coin would have many advantages. It would be readily distinguishable from all other coins. It would be attractive in color, pure cobalt being similar in appearance to pure nickel, but somewhat more silvery, and tarnishing slowly, if at all. Being very hard, it would be difficult to counterfeit. Lastly the chief source of cobalt being for the present in Canada, a cobalt coin would be distinctively Canadian, and its introduction would strike a chord to which the national consciousness would readily respond. The coin could be called a "cobalt," just as the U. S. 5-cent piece of copper-nickel alloy is called a "nickel." By comparison, however, a pure cobalt coin would be greatly superior in appearance and every other respect to the so-called "nickel," which contains only 25% of that metal.—T. W. GIBSON, in Annual Report of Bureau of Mines, Ontario.

LAND \$300,000 CONTRACT

Mr. Warren R. Roberts, president, and Mr Edward E. Barrett, vice-president, of the Roberts & Schaefer Co., engineers and contractors, Chicago, have just returned to Chicago after securing in Canada a contract with a large coal company for the designing and construction of an electrically operated anthracite coal dock bridge, and storage plant. This will be one of the most modern installations of its kind in Canada.
