

# —does your sharpener stay “on the job”?

**Reliability** is a prime requisite of Drill sharpener service. A machine that is “down” for repairs when it is needed to make bits, delays production and runs mining costs up rapidly, aside from the bills for new parts.

Sullivan sharpeners are built substantially, with plenty of reserve strength to resist the heavy strains of incessant hammer work and high air pressure.

Note the massive design of this machine, and the generous dimensions of anvil blocks, yokes and crosshead studs. Sullivan sharpeners are dependable. They stay “on the job” from year end to year end.

## Here are quotations from a few reports from customers which tell the story :

“Repairs less than \$15.00 yearly.”—Nevada.

“Operated for one year without requiring any repairs.”  
—Missouri. (Served 14 hammer drills.)

“No repairs in 12 months.”—Ontario. (Served 10 drills.)

“Repairs practically nothing for 2 years. (broke 2 dollies.)”—Colorado. (10 drills served.)

“No repairs in 2 years—200—300 bits per day.”  
—Arizona.

Service like this may be expected from every Sullivan Sharpener that leaves our works.

Why not send for Bulletin 672-C?
