

rounding to the flat and strongly-oblique face. Front narrow at base one-half longer than wide. Elytra moderately long, closely folded behind.

Colour: Vertex, face and scutellum creamy-yellow, a black point just outside the loræ. Pronotum and most of the claval areas green. The outer margin of claval areas and the inner half of corium smoky-brown, the costal margin subhyaline.

Genitalia: Female segment slightly wider than long, posterior margin concave, with the lateral angles rounding. Male valve short, bluntly produced, plates together long, acutely triangular, half longer than their basal width, their attenuate apices clothed with numerous long hairs.

Described from ten examples from Ontario, Pasadena and Tia Juana, California, collected by the author. In life there is a metallic-iridescence which heightens the striped appearance of this distinctly-marked species.

*Thamnotettix generosa*, n. sp.

Size and form of *gemella* nearly, the vertex more pointed. Resembling *gloriosa* in colour. Length, female 5 mm.; male 4 mm.

Vertex right angled, the apex acute, about half wider than long, disc transversely convex, sloping to the slightly rounding margin of the face. Face strongly receding, the apex of vertex and face distinctly conical. Front narrow, wedge-shaped, the margins straight. Elytra long, appressed.

Colour: Vertex and face pale lemon-yellow, a pair of black dots outside the loræ. Pronotum yellowish-green. Elytra pale yellowish-green, shading out to subhyaline towards the costa and apical cells. Some of the males are inclined to be smoky-iridescent, while one female is all pale lemon-yellow.

Genitalia: Female segment two-thirds as long as its basal width, the posterior margin gently convex, the lateral angles broadly rounded. Male valve obtusely angular, plates long, slender, together slightly concavely attenuate, over half longer than their basal width.

Described from ten examples from Colfax and Visalia, California, collected by the author.

*Thamnotettix gerula*, n. sp.

Form of *generosa* nearly, but larger, as large as *longula*. Greenish-yellow, with a black band covering all the elytra before the appendix. Length, 6 mm.

Vertex slightly obtusely angled, the margins straight, less than one-half wider than long, disc slightly convex. Face flat, acutely angled with
