

**Safe
Reliable
and
Efficient**

When you select Shimer Cutter Heads you get more than a mere assembling of materials. You get an outfit that combines the skill of the expert workmen, the most approved mechanical features and years of experience.

THE SHIMER CUTTER HEADS

are made of Steel that is forged and hammered into dies. We use this material because of its close grain, uniform solidity and dependable strength. Machines to-day carry faster feeds; the spindles in them run at greater velocity; the Heads must sustain increased working strain as well as to overcome the power of centrifugal force. Metals from which Cutter Heads are made must be stronger, tougher and more firm in grain and texture to successfully meet requirements of to-day.

Let us send you full particulars about the later makes of Shimer Cutter Heads---how they can be expanded to suit different thicknesses of material in an instant---how they will save you all the "fitting and trying"---how they will remove many of the annoyances which come up daily.

Our No. 29 Catalogue and Pattern Book contains 200 pages of Cutter Head information which we are pleased to mail on request.
