

one complete establishment worked by steam. A large number of hands find employment here.

This is the only place in Canada where pulp is made of wood, to be used in the manufacture of paper. The kinds of wood most in use, are basswood and poplar. The pulp thus made is mixed with about one fifth of rags or other fibrous material, and manufactured into excellent paper. That made in Sherbrooke is already used extensively in the newspaper establishments of our country.

Isolated as Windsor had long been before the construction of the railway, frequent and familiar intercourse had been kept up with the settlement opposite, till from habit and constant association the people of both sections had come to consider themselves members of the same community.

It is now in contemplation to unite the two localities by a bridge over the St. Francis, which will serve as an additional bond of union.

For some distance above the mills, along the course of the St. Francis there are a series of rapids, known as the "Little Brompton Falls," which offer sites for the erection of mills to a great extent. Taken altogether this situation is said to be unrivalled in the Eastern Townships for manufacturing purposes. The rocky banks of the river afford a firm foundation; there is sufficient fall; the flats along the margin are high enough to be safe from harm by inundation, and the contemplated bridge between Brompton and Windsor, would bring such works near the railway station at the latter place.
