THE FAMOUS CEMENT BLOCK MACHINE

Winner of First Prize at Michigan State Fair

Makes a concrete face down block of 100 per cent. more strength with one-third less cement and cheaper than the sand blocks usually made by other block machines. This is how we do it. We use coarse material which means less cement. There being no core in the way a flat tamper can be used which means uniform tamping on the face and uniform strength of block. Enough water is used to make a concrete block almost equal in strength to natural stone. Pallets used are wood costing from 6 to 8 cents a piece and one size only is necessary for all sizes of blocks. No studding or lathing is required. Plaster is put right

on wall. Block made in any length from 6" to 24" long and a wall from 8" to 16" thick. Block is up-to-date in design and can be faced with granite, marble, brown stone or any material. The wall is bound every foot and every 9" making the most strongly bound wall built. No metal ties are used. It is a two piece moisture-proof wall on account of the continuous air space and non-continuous bond. The machine is rapid working, strong and durable and can be operated by a boy of 12. Each man working will turn out from 100 to 125 blocks a day.

Write for a catalogue and see cuts of the wonderful moisture-proof wall.
