## ROSES.

IT WILL BE REMEMBERED that the Directors have offered a rose plant to those who prefer to receive it as one of the articles to be sent to our subscribers in the Spring; and so, by way of reminder, this number brings to its readers a beautiful colored plate of this beautiful flower.

Fortunately there is no need that we tell of the beauty of the rose. Every one treasures bright visions of them, mingled with memories, and intertwined with associations that give a lustre or a mellowness to their beauty, awakening at the very thought of them emotions of pleasure. Every one admires the rose; every one would grow the rose. But it is not every one who grows the rose that grows roses. Success in this, as in all else, is the outcome of a love that ever burns but never consumes. Down, deep down in the innermost depths of the heart, it is ever glowing. The snows of winter may wrap the rose trees with their frosty mantle, but no chill reaches that love; nothing can ever damp its ardor. Tenderly the true lover waits on his Queen with untiring constancy; none the less when come the autumn days, with the sere

and yellow leaf, than when she is just budding into beauty, or glowing in all the splendor of queenly majesty. To those who can thus care for her, anticipate her needs and guard her from danger, she comes forth in all her loveliness. As an eminent English cultivator has tersely expressed it, "he who would have beautiful roses in his garden must have beautiful roses in his heart."

Much has been written on the cultivation of roses that needs to be modified somewhat to meet the peculiarities of our Canadian climate; hence a few hints are here given that it is hoped may be of some value to our readers, inasmuch as they are the results of some years of experience in growing the rose.

Select for the rose garden a spot that is sheltered from the sweep of the winds, yet not too near to growing trees, lest their roots rob the roses. If it be practicable, let groups of evergreens break the force of the winds, and temper their fury.

Mulch the ground with a liberal hand both summer and winter; thus will the roots be protected from mid-
