-consists. Principal among these are physical diagnosis, bacteriology, the examination of the gastric contents, the urine, blood and feces. As this has necessitated the student procuring separate books upon these topics, the authors of this work have combined in one volume, as far as possible, the essential of these branches as applied to Clinical Medicine. The arrangement of the special topics has been adopted to prevent repetition, to present as concise a description of allied subjects as possible, and to link more closely the various divisions. Thus the pathogenic germ of a spinal disease is considered under the head of Clinical Bacteriology, rendering it unnecessary for one already acquainted with such facts to again read the morphology, the biology, the pathogenesis, etc., when dealing with the description of the disease. If the reader should be unfamiliar with the subject, such facts will be found in the section that deals with the micro-organisms that are of importance in Clinical Medicine. A similar course has been followed in regard to physicial diagnosis, examination of sputum, stomach contents, blood, rurine and feces. The authors have been most successful in giving the main facts of the etiology, pathology, symptoms and prognosis, but we confess we do not admire the terse and brief outline of treatment which is sometimes given. As illustration we mention Pertussis, where the treatment is summed up in eight lines, and in which we do not find any mention of such drugs as quinine, belladonna, etc., which some physicians from clinical experience consider most valuable. Notwithstanding this fault, the work is thoroughly up to date, and will often be found a valuable counsellor.
