

known tuberculin test of herds, with proper repetitions, and the elimination of the tuberculous animals. Serious enough as cattle tuberculosis in the human is, its prevalence, nevertheless, is much less than that of human tuberculosis and its infectiveness in the human is nearly negligible. Hence, if our efforts were concentrated wholly on human tuberculosis, more cases and more deaths would be prevented in one year's work, than efforts on bovine tuberculosis, however successful, could possibly achieve in many years.
