CEMENT PIPES.
For Small Irrigating Ditches and Other Purposes.
By G. E. P. SMITH, Arizona experiment station.
Both seepage and evaporation from irrigating ditches are prevented by closed conduits. Cement pipe for small irrigating ditches is from every point of view to be recommended. It is composed largely of sand and gravel found in the vicinity of the ditches, and only the cement is subject to a freight charge.
With a view to determining the best mixture and the cost of cement pipe in the Santa Cruz valley a moulting outfit was secured and some experiments were made. The size selected was of fifteen inches inside diameter, and several lots of pipe were made.
In the second cut is shown some of the pipe in lot No. 2. It was made of a mixture of one part cement to three and one-half parts unscreened arroyo sand. There were ten two-foot lengths, each hard and strong, of perfect shape and representing a cost of only 38 1/2 cents per lineal foot. The amount of cement used was five sacks.
The fourth lot was made of a very lean mixture of cement, lime paste and sand. The requirement of a part of the cement by lime was made for the double purpose of reducing the cost and obtaining a denser and more impervious pipe. The paste was thinned to a consistency that permitted it to mix thoroughly with the sand, and the bell ends were made of a mixture of one part of cement to three parts of sand. The results were very satisfactory.
The fifth and sixth lots were made in another locality, and the sand and gravel were of a different character from those used previously, so that screening was necessary. All above one-half inch in size was rejected.
The first cut, from a photograph, shows two the completed and two laborers tamping a third tile.
Regarding the mold to be used and the shape of the tile there will always be differences of opinion. In California

TAMPING THE CONCRETE.

mental pipes were made. The size selected was of fifteen inches inside diameter, and several lots of pipe were made.

THE GONDOLA.
Its Gliding and Guiding Through Venetia's Intricate Canals.
The gondola is so perfectly adapted to its purpose that it is like a sentient thing in the gondolier's control. It obeys the slightest impulse of the oar. Through the narrow and intricate lanes of Venice, with the sharp and darting turns, it glides with unerring accuracy. The boatmen have about ten different calls by which they announce their approach, as they come to a corner, the turn they will take in a crowd, their way to right and left and all that. And these calls, half song, half cry, echo day and night, and yet so musical are they that they seem to be merely a part of the brooding silence of Venice.
Indeed the wonder of Venice is how all things—the city and the sea, the boats and the songs and the sky—combine to make one perfect whole, crossing and idle as one of Petrarch's sonnets, which one I care not. Here even death is not merely somber. It is friendly and familiar as well. I saw them put old Paolo to bed for the last time. He had been in his prime a stout gondolier of the tract of Santa Sofia, near the Rialto, and he was now a ragged, shivering old man of the gray. In his quart, however, he was a respected man. Indeed to me he was a friend, and he had been a gondolier a title to tenderness and respect. And so when a good man dies in the power quarters the neighbors combine and hire a house and to celebrate his virtues—Vance Thompson in Orling Ynglinga.

RHEUMATIC PAINS RELIEVED.

OPTICAL ILLUSIONS.
Striking Examples That May Be Observed in Daily Life.
Doubtless every one has observed while traveling by train that the trees or houses in the distance appear to be speeding along in the same direction as the train, while the nearer objects are fast receding. Many, too, have observed that the top of a level wall built on a steep incline appears to slope upward in a contrary direction to the hill itself at nearly the same angle to the apparent level, and some have curiously regarded the ghostlike gliding and vanishing of dark shadows while passing a double row of fencings, but the following are not so commonly remarked:
One might stand for several minutes watching the revolutions of the cups of an anemometer—for measuring the velocity of the wind—and still be puzzled as to the real way they are turning round. Gaze up at them when there is an uncertain breeze blowing. They revolve rapidly, and you are perhaps perplexed as to their direction. As the wind subsides you would expect to find it easier to tell the direction by the slower revolution; but, as a matter of fact, the difficulty is increased. With the varying speed your first impression is that such and such is the direction. A moment later you reverse that idea, and the longer you gaze the more it seems as if they are spinning round erratically in every possible direction, whereas, of course, they can only turn one way.
Standing immediately beneath a high wall of a building—the longer the wall the better for practical demonstration—many would aver on looking upward that it was not exactly perpendicular, but inclined toward the right in a threatening manner. This is a direct effect of perspective and would be to better advantage if a

ALMOST GIVEN UP
"FRUIT-TIVES" SAVED HIS LIFE
Mr. Dingwall Superintendent of St. Andrew's Sunday School, Williams town for nine years and License Commissioner for Glenora—and Tax Collector for Charlottetown—for fourteen years continuously. Read how strongly Mr. Dingwall comes out in favor of "Fruit-tives."
"I have much pleasure in testifying to the almost marvellous benefits I have derived from taking "Fruit-tives." I was a life long sufferer from Chronic Constipation and the only medicine I ever secured to do me any real good was "Fruit-tives." This medicine cured me when everything else failed. Also, last spring, I had a severe attack of bladder trouble with kidney trouble, and "Fruit-tives" cured these complaints. I was when the physician attending me had practically given me up. I am now over eighty years of age and I can strongly recommend "Fruit-tives" for Chronic Constipation and bladder and kidney trouble. This medicine is mild like fruit, is easy to take, but most effective in action."
Sgd JAMES DINGWALL.
"Fruit-tives" — or "Fruit Liver Tablets" are sold by dealers at one box each for 50c. and will be sent on receipt of price. Fruit-tives Limited, Ottawa.

Williamstown, Ont., April 24th, 1907.

SEED CORN.
Not a Difficult Matter to Determine a Vitality of Ear.
There is serious danger that this year's corn crop will be limited by a poor stand of plants.
Many growers will be compelled to buy seeds in such cases do not risk purchases from a different latitude. If good seed of a productive variety cannot be bought near home, then make sure that the seed has been grown in a section having a similar growing season, advises a writer in National Stockman and Farmer. Even if the corn is sold as tested seed buy early enough to enable you to make a test for yourself before planting.
The First Thing to Do.
The first thing to do is to test the corn that one is planning to use. It will pay to do this right. Make some boxes three inches deep and, say, eighteen inches square. Partly fill with sand or any other material that will hold moisture. Place on this a square of muslin that is marked in one inch squares and numbered. On each square place four kernels of corn taken from different parts of the ear, one square for each kernel that is to be tested. Give the ear the same number as the square by writing the number on a slip of paper and tying it around the ear. Cover the corn in a box with a pad that will hold the moisture, and keep the box in a warm room. Select for planting only the ears whose sample kernels have shown strong germinating power. If one kernel in four fails to germinate, or if the germination is slow and weak, reject the ear. The task of testing is not nearly so great as these directions may indicate, and in this way one may know that all the seed is capable of making a strong growth of plants.
It pays every year, but this year it will be unusually profitable. Much corn will not grow at all, and very much will germinate only under the most favorable conditions, and some cold, wet weather after planting will rob it. But the surest way to get the best that is not full of vitality, and this method of testing will enable any one to do so.

Many growers will be compelled to buy seeds in such cases do not risk purchases from a different latitude. If good seed of a productive variety cannot be bought near home, then make sure that the seed has been grown in a section having a similar growing season, advises a writer in National Stockman and Farmer. Even if the corn is sold as tested seed buy early enough to enable you to make a test for yourself before planting.
The First Thing to Do.
The first thing to do is to test the corn that one is planning to use. It will pay to do this right. Make some boxes three inches deep and, say, eighteen inches square. Partly fill with sand or any other material that will hold moisture. Place on this a square of muslin that is marked in one inch squares and numbered. On each square place four kernels of corn taken from different parts of the ear, one square for each kernel that is to be tested. Give the ear the same number as the square by writing the number on a slip of paper and tying it around the ear. Cover the corn in a box with a pad that will hold the moisture, and keep the box in a warm room. Select for planting only the ears whose sample kernels have shown strong germinating power. If one kernel in four fails to germinate, or if the germination is slow and weak, reject the ear. The task of testing is not nearly so great as these directions may indicate, and in this way one may know that all the seed is capable of making a strong growth of plants.
It pays every year, but this year it will be unusually profitable. Much corn will not grow at all, and very much will germinate only under the most favorable conditions, and some cold, wet weather after planting will rob it. But the surest way to get the best that is not full of vitality, and this method of testing will enable any one to do so.

SEED CORN.
Not a Difficult Matter to Determine a Vitality of Ear.
There is serious danger that this year's corn crop will be limited by a poor stand of plants.
