SPRAYING IN THE VEGETABLE GARDEN

Convincing Arguments in Favor of Proper Spraying-Some Striking Illustrations.

Does it pay to spray potatoes in New Brunswick? Does it pay to spray celery? Wheat or oat is a plant. The body of Growers have been asking these questions for many years, while some others have neither asked nor thought about it. They have been growing potatoes as their fathers did, and really do not know whether the potato industry is a profitable one or not. We are well aware that in the great potato beetle only, while the various forms vicinity up-to-date methods of spraying are practiced, but the great mass of farmers outside that section spray for the potato bettle only, while the various forms of fungi run their course without molestation, and when his crops are "struck with rust," he says: "Farming does not pay."

1, Marketable; 2, unmarketable; sprayed once with lime sulphur; 3, marketable; 5, unmarketable; sprayed once Bordeaux; 5, marketable; 6, unmarketable; no spray.

The illustration indicates the relative yields per acre of potatoes sprayed with the various spray mixtures for fungi. In case of the "cheek," the beetles were killed with Paris green, but no fungicide was used.

The truth is potato blight, which causes rotting of the tubers, is as easily controlled the potato beetle if spraying is done in the potatoes will be taken in straining the lime in another containing twenty gallons. These two are then poured together. The resulting mixture is Bordeaux. Care should be taken in straining the lime lest there be difficulty in getting the mixture to pass through the nozzles of the spray pump. Raris green may be added to this and the beetles and fungi are thus controlled at the same time.

When the farmer speaks of the rust on his potatoes what does he hope to do? The "blight" of potatoes is a plant. True, it is a very low form of plant life, but a life, but a life to the potatoe is a plant. True, it takes to that flea-beetles and early blight takes so that flea-beetles and early blight takes or the potatoes where the potatoes were co

usually go hand in hand. The losses caused by early blight are frequently heavy but this is not usually the case.

This fungus causes no rotting of tubers, but arrests the normal development of the plant, and a consequent lessening of the yield. The late blight is much more serious. It is a very old potato malady and has caused great disaster in many potato growing regions. The serious famine in Ireland was very largely due to the failure of the potato crop, because of the prevalence

Sprayed With Bordeaux Mixture.

Not Sprayed.

Here, truly, is a new Mr. Borden. The difference is accounted for, no doubt, by his different relation to Mr. Monk. When they were out of office he and Mr. Monk ould flour each other to their hearts' content, and each say just what he thought of persons and things. But now Mr. Borden cannot express an opinion in which Mr. Monk does not concur; and as Mr. Monk d
