HOLT CASTLE;

THE THREE-FOLD INTEREST IN THE LAND.

PRICE THREE SHILLINGS AND SIXPENCE.

OPINIONS OF THE PRESS.

Wilts and Gloucester Standard.

"This is another of the pleasant series of books in which P. fessor Tanner conveys so much good practical information in so agreeable a manner, but whilst it abounds, as the former works did, with useful hints on all that relates to the science and practice of farming, the present work has a special object of its own, viz., to show the legitimate importance of 'woman's work,' not only in the farmer's wife, but also in the landlord's and the labourer's. That this is done without any dry, prosy essay on political economy will be readily understood by those who are already acquainted with Professor Tanner's light, chatty style, which makes his books as pleasant as they are instructive."

Newcastle Courant.

"It will be seen from these brief extracts that it is a book for all who have an interest in agriculture. It contains an immense amount of information, and is at once instructive and entertaining. The fact that there are few who could have written it is the best reason why many should read 'Holt Castle; or, the Three-fold Interest in the Land.'"

ELEMENTARY LESSONS.

IN THE SCIENCE OF

AGRICULTURAL PRACTICE.

THIRD EDITION.

PRICE THREE SHILLINGS AND SIXPENCE.

OPINIONS OF THE PRESS.

Dumfries Courier.

"While it is admirably systematised, it deals with such simplicity and clearness with the different parts of the subject that 'he who runs may read,' and yet they are withal treated in such a masterly, comprehensive way, that persons of all ages interested in agriculture who read it, cannot but do so with much interest and profit. We would cordially recommend all who wish to make themselves better acquainted with the principles on which the science and art of agriculture are based to procure this work, and not only to read it, but so to ponder over it as to make it a matter of systematic study. There is this valuable feature about all Professor Tanner's educational works which will make them acceptable to practical farmers, that not only does he insist, in the most emphatic terms, on the science of farming being modified and guided to a considerable degree by practice, but he again and again appeals to practice in illustration and confirmation of these principles. We cordially wish Professor Tanner's work a large sale, which it eminently deserves, because of its intrinsic merits, and also because it will impart valuable information to those who peruse it, and also beget in their minds a desire to obtain more."
