ACUTE AND CHRONIC RHEUMATISM.

This northern climate, with its extremes of heat and cold, with its rainy spring and fall season, coupled with the fact that the occupations of most of its inhabitants cause them to be exposed to the inclemency of the weather, renders it a fit breeding ground for that most agonizing of diseases—Rheumatism. Sometimes, however, persistent dyspepsia, excessive indulgence in intoxicants, or any condition that interferes with kidney action, brings on an attack.

The suffering endured by some of those afflicted, beggars description. The joints become swollen, red and inflamed, the slightest movement produces the most intense pain; when the acute stage passes off there is left behind stiffened, distorted, painful joints—a life-long heritage of suffering.

The usual mode of treatment is to apply liniments, embrocations, or fomentations to the painful part. These, no doubt, give some relief, but seldom have they been known to produce a cure, alone and unaided.
