PANOPEPTON

Considered Clinically

Continued clinical experience with Panopepton shows a net gain from its use far beyond the original anticipations which were so thoroughly well justified by the nature of the food itself.

There are records to show that in cases of extreme intolerance of food, Panopepton is often retained after every other form of nourishment has been rejected.

In persistent nausea, it renders truly remarkable service in allaying irritation and preventing exhaustion. And under all conditions where such a food is indicated, it acts promptly as a restorative, not only by providing nutrition without taxing energy, but by the directly stimulating effects of its savory and nitrogenous constituents.

Panopepton is a wholly absorbable food; leaves no debris to cause complications due to putrefactive changes, and herein the patient derives benefits, obvious and potential, that are beyond chemical and caloric estimation.
