

THE ROYAL VICTORIA HOSPITAL
MONTREAL

Many details remained to be arranged but I have reason to believe that matters have, since then, progressed satisfactorily. I am expecting to receive, by any mail, further word from Dr Knox as to later developments.

It is the intention of the Association to establish sub-centres throughout the Empire in connection with the Central Association in London, in much the same way as has been done by the Royal College of Music.

It would seem as though the time had now arrived for McGill to take an active part, and to establish a regular course in Radiology.

In my opinion every medical student should take such a course - beginning with the technical part of the subject in the third year, or fourth year, and having a thorough course of lectures on X-Ray diagnosis during the final year.

Every medical man should know at least the principles of X-Ray technique, and should be able to read X-Ray plates. For the latter part of the subject a knowledge of pathological processes is essential, therefore it is suggested that this part of the course should be left to the final year, to be studied along with the clinical subjects. I believe there is enough material for one or two lectures a week during the final year.

I am not at present sufficiently familiar with the final year curriculum to enter into details.

I remain

Yours very sincerely
