

\*The reason why platinum answers better than any other metal for the leading-in wires of the incandescent lamp is because of its rate of expansion and contraction by heat, which is about the same as glass. Thus the vacuum in the lamp is maintained as it could be by no other metal now known.

Determined attempts are being made in Chicago to suppress the blinding smoke that is blown ashore from passing steam-craft. An experiment was made recently to demonstrate the practicability of a new invention. A small tube with a perforated top like that of a sprinkling can, was introduced into the smoke stack, and through this steam could be injected upon the uprushing smoke, which immediately condensed. The little tube with its jets and sprays of steam, is not a steam consumer, but there seems to be little doubt of its utility in the prevention of smoke.
