ers and can be viewed only for study's sake. To comply with the legitimate curiosity of the visitors, a certain number of duplicates with names, is exhibited in cases which represent the various orders of insects.

One can see with interest a complete collection showing the history of the principal silk-worms and of the honeybee with its enemies; also remarkable specimens of the architecture of insects and of their metamorphoses.

## Conchological Collection

This collection contains more than 1250 species of Canadian and foreign mollusks, nearly all classified, a good number of which are remarkable for their brilliant colors, size and curious forms. Such are the Murex, the Strombuc, the Dolium, the Cypræa, the Cassis, etc. We may mention a magnificent American collection of the genus Unio, for which the Laval University is indebted to Mr. Isaac Lea, LL. D., a learned conchologist of the United States of America, and beautiful samples of wood perforated by the Teredo navalis.

The samples of invertebrates of the Atlantic from a very precious collection,
