## OF

The purpose of this study was to determine the effect of the treatment of the soil on the growth of the plants. The results of the study are as follows:

1. The treatment of the soil with the chemical substance resulted in a significant increase in the growth of the plants.

2. The treatment of the soil with the chemical substance resulted in a significant increase in the yield of the plants.

3. The treatment of the soil with the chemical substance resulted in a significant increase in the quality of the plants.

4. The treatment of the soil with the chemical substance resulted in a significant increase in the resistance of the plants to diseases and pests.

5. The treatment of the soil with the chemical substance resulted in a significant increase in the resistance of the plants to drought and frost.

6. The treatment of the soil with the chemical substance resulted in a significant increase in the resistance of the plants to salt stress.

7. The treatment of the soil with the chemical substance resulted in a significant increase in the resistance of the plants to heavy metal stress.

8. The treatment of the soil with the chemical substance resulted in a significant increase in the resistance of the plants to acid stress.

9. The treatment of the soil with the chemical substance resulted in a significant increase in the resistance of the plants to alkaline stress.

10. The treatment of the soil with the chemical substance resulted in a significant increase in the resistance of the plants to oxidative stress.
