much more dense than in *ovata*: last ventral of male small, its hind border in both sexes finely pectinate. Length 4.5–5.2 mm.

Nine specimes beaten from the flowers of the farkle-berry, Vaccinium arboreum Marsh, near Sanford and Ormond, March 29th.—April 6th. Easily told at a glance from ovala by the much more dense and coppery vestiture. Mr. Blanchard wrote me that he had had it separated but not named in his collection for more than 40 years.

Hallomenus fuscosuturalis, sp. nov.

Elongate-oblong. Dull brownish yellow, sparsely clothed with fine prostrate yellowish hairs; elytra with a common sutural fuscopiceous stripe which is widest in the region of the scutellum, the margins also often darker than the disk. Head finely and evenly punctate; eyes small, deeply emarginate on the inner side; antennæ with second joint one-half the length of third, joints 3–11 subequal and one-half longer than wide instead of subquadrate as in the other species of the genus except serricornis. Thorax at base one-half wider than long, sides gradually rounded to apex which is one-third narrower than base; disk finely and densely punctate, the basal impressions feeble. Elytra as wide at base as thorax, sides parallel for three-fifths their length, thence gradually converging to the rounded apex; their surface, as well as that of abdomen, very finely and much less closely punctate than thorax. Length 3 mm.

Six specimens beaten from scrub-oak and willow near Sanford. March 28—29, 1911.

Newfoundland Lepidoptera.—In a little box of insects collected at St. Anthony's during the summer of 1910, were specimens of Argynnis freija Thunb.; A. myrina Cran.; Colias pelidne Bdv.; Coenonympha inornata Edw.; Apantesis virguncula Kirby; Aplectoides livalis Smith; Anarta cocklei Dyar; Mamestra sutrina Grote; Autographa alias Oltol.; Epirrita dilutata D. &. S.; Epelis truncataria Walk.; Pyrausta insequalis Guen.; Crambus unistriatellus Pack.

A. F. Winn, Westmount.

Lycaena comyntas Godt.—While collecting Geometridæ after sundown at Valcour, N. Y., July 25th., I found a male L. comyntas asleep on a blade of grass. Like many other "Blues," it rests for the night head downwards, the tails of the hind-wings and the black spot strongly resembling a pair of antennæ and an eye at the wrong end. A second specimen was found in the same attitude after a few minutes' search.

A. F. WINN, Westmount.
