

5. Measures should be taken to remedy any physical defects.
 6. Pupils in these classes should be under observation long enough to determine mental ability and trend of mind.
 7. These observations should be made by the teacher, principal, medical inspector, nurse and psychologist.
 8. When the child's mental ability is determined he should be assigned to either (a) regular grade work, (b) to an institution, or (c) to a vocational class or some other special class for sub-normals.
 9. I saw three types of these classes, (a) Special industrial classes for boys, (b) special industrial classes for girls, (c) special mixed classes for younger children.
 10. When these children in the special classes for sub-normals are beyond school age two alternatives are before us: (a) Institution, (b) work at home or at some vocation where careful supervision is possible.
- If these conditions cannot be fulfilled he thinks the only alternative is a special institution to take care of the defective children.

SAUNDERS' CATALOGUE.

W. B. Saunders Company, publishers, of Philadelphia and London, have just issued their 1916 eighty-four page illustrated catalogue. As great care has evidently been taken in its production as in the manufacture of their books. It is a descriptive catalogue in the truest sense, telling you just what you will find in their books and showing you by specimen cuts, the type of illustrations used. It is really an index to modern medical literature, describing some 300 titles, including 45 new books and new editions not in former issues. A postal sent to W. B. Saunders Company, Philadelphia, will bring you a copy—and you should have one.

MEDICAL PREPARATIONS

CARYZA—ACUTE NASAL CATARRH.

This condition is manifested by a local congestion of the nasal mucous membrane, with an infiltration of serum into the tissues and later an exudation on the part of the musous membrane.

The local treatment calls for a remedy capable of relieving the engorgement of exosmosis, which can never be relieved by the use of acid or astringent preparations.

The use of Glyco-Thymoline in these cases purges the musous membrane, relieving the congestion, and then by stimulating the local capillary circulation to renewed activity prevents a re-engorgement.
