

wide range of subjects, though most are connected with the special diseases of man and animals met with in the country. The most interesting reports are probably those on the distribution of mosquitoes and their relation to malaria, and upon trypanosomiasis in man, cattle and mules. There are also some interesting notes on human, animal and vegetable pests, while the report of the chemist will well repay reading. The report is well illustrated and its contents bear witness to the activity of the staff, and stand, too, as a marked evidence of the remarkable change which has taken place in the Sudan, which well within a decade was practically a howling wilderness under the control of the Khalifa and unsafe for white men.
