Marketing Profile

R.R. McGlogan Equipment Ltd. is a thirteen year old Canadian company which specializes in automotive engine rebuilding machinery and accessories. Products manufactured are cylinder head-block pressure testers used to locate cracks or perforations in auto, truck, and marine engines, and engine run-in machines used for testing short block engines before installation.

The newly designed cylinder head fixture and milling cutter was designed to convert industrial milling into a guide seat machine and cylinder head resurfacing machine, giving more versatility and saving the cost of purchasing conventional guide and seat machine and cylinder head resurfacers. R.R. McGlogan's cylinder head milling machine conversion kit will be most useful to low income countries as it will greatly reduce the capital required to start an engine rebuilding shop.

R.R. McGlogan Equipment Ltd. is Canada's largest distributor of used engine rebuilding equipment.

Purchasing good used engine rebuilding equipment is the most reasonable method for countries wishing to start up low cost engine rebuilding shops.
