

We have examined the paper and find that it is misleading, inaccurate and biased against agriculture. It has done irreparable damage to the image of farmers, which will now take considerable time and energy on our part to set the record straight. It is not our intention to dissect this paper and give you a detailed critique. That job is being done by other agricultural organizations appearing before you.

As a result of our meetings with thousands of farmers and agricultural associations across the country, it has become very evident that the rural scene is deteriorating rapidly and a social explosion is not impossible now.

Our present financial systems are inadequate and the ingredients for a crisis remain. The question is whether those in command can recognize the problem soon enough to take some positive action before the situation reaches a point of no return.

### Now the Good News!

We bring you good news. Good news about the future - good news on how we can turn the economy around. The information we have to share is exciting, fascinating and positive .

There is a solution to our economic problems. An Economic Bill has been written and presented to Parliament. However, its positive impact has passed this far, with limited understanding. This bill, if passed, will put the Canadian economy on its feet and get the unemployed back to work. It will guarantee farmers cost of production plus a small profit. It will lead to a balanced federal government budget and will not require subsidies or stabilization spending. Sound too good to be true?

Bury your doubts. National Prosperity is the dream of all Canadians. National Prosperity is possible. The key, the solution to our problems is Bill C 215, A Parity Bill.

Parity is the truth. It is fact (not theory). It has a positive track record and has been proven in history. It is backed by 40 years of research and a National Economic Audit. This key to national prosperity is based on Wilkens Law. Wilkens law states that for any nation in the world to prosper, New Wealth must be created. New Wealth comes from our basic resource industries; farming, fishing, forestry, and mining. New Wealth is crops from the field, fish from the sea, lumber from the forests, and ore from our mines.

Example: A farmer plants one bushel of corn and reaps 300 bushels of corn. That's 299 new bushels of corn that never existed which have been created. That 299 bushels of corn is New Wealth.
