The story of Canada is in many ways a record of the solution of problems presented by the vastness of the country. Sheer space, however, has not been the only obstacle to be overcome; there have also been such formidable barriers to transportation and communication as the Rocky Mountains and the Canadian Shield. Besides, the lines of geographical similarity and economic interest run north and south across the boundary between Canada and the United States, not east and west across Canada. Hada tot enoitheilious edit

It is, therefore, obvious that the Canadian nation could attain its full development only with the help of an extensive and costly system of communication. From the outset, Canada's growth has depended on the development of water, rail, road and air transportation. A web of communications has been gradually spread across the country, opening the way to new resources and stimulating economic development. Only against this background can such an achievement as the construction of the Trans-Canada Highway fully be gauged.

The building of highways and roads in Canada is primarily a provincial responsibility. Since 1919, however, the Federal Government has, for various reasons, participated in the construction of highways. It is, of course, wholly responsible for building and maintaining the roads that serve the national parks and the Yukon and Northwest Territories, and for the upkeep of the Alaska Highway. In the construction of the Trans-Canada Highway, however, the Federal Government, in co-operation with the ten provincial governments, has made its largest contribution to road building. Since the passage of the Trans-Canada Highway Act in 1949, provincial and federal authorities have pushed steadily toward the realization of a 4,796-mile paved, all-weather route from St. John's, Newfoundland, to Victoria, British Columbia.

While the provinces undertake the actual building of the Highway (except those stretches that cross the national parks), the procedures governing design and construction are subject to review and approval by federal authorities, and arrangements are such that federal engineers inspect the work as it proceeds.

tons of rock and an equal amount of dirt had to be moved, a job requiring 5,000
