Arnett Wagon Water Tanks

Arnett Half-Round Water Tanks make the old square kind look like last

Arnett Half-Round Water Tanks are not cut by the wheels in turning. Arnett Half-Round Water Tanks are constructed so that a simple twist of the wreness stops all leaks.

Arnett Water Tanks are always ready for use.

Arnett Water Tanks do not cost more than ordinary water tanks.

A pair of bunks is furnished free with each tank.

Made in two sizes, 12 barrels and 16 barrels.

Arnett Water Tanks have been in constant use for 12 years.

You should have our Illustrated Price List of Wagon and Stock Water Tanks. A request will bring it free.

istration of Fowler's Solution of Arsenic in doses of two tablespoonfuls each night and morning in the drinking water.

Few, if any, cases of genuine swamp fever recover, and where recoveries take place the diagnosis was probably in error.

in error.

It is possible on the other hand that your horses suffer from selectioniasis, which is caused by the animals becoming infested with a small blood sucking worm, which lies inheded in the intes-tinal wall.

tinal wall.

The manure should be carefully examined for the presence of the worm, which is a small thread-like parasite from 1-3 to 1-2 an inch long.

The treatment for this condition consists of tablespoonful doses of Creolin every morning and the same quantity of oil of turpentine each evening, administered as a drench in a pint of milk.

This treatment should be followed at the end of a week by giving a pint of

the end of a week by giving a pint of raw finsced oil.

The above doses are for a full-grown

In above goes are for a target horse and may be decreased for animals of two years and under. In no case should the horses he re-turned to work until recovery seems to be complete.—W. A. Shoults, V.S.

Foal is Stifled

O.—When colt was a month old it seemed to lose power of the muscles of its hind legs, becoming stiff and unable to use its hind legs or just draw them behind. After having these attacks it would be affected again very suddenly and tumble over. Kindly state the trouble and remedy, if any. A Reader, Alta.

Kindly state the trouble and remedy, if any. A Reader, Alta.

A.—Your colt appears to suffer from dislocation of one or both stifle joints. This condition is the result of weakened muscles or ligaments, which permit the stifle bone or cap of the stifle joint to slip off. When the joint is so dislocated the limb appears perfectly stiff and rigid and cannot be brought forward. The foal's efforts to move the hind limbs constitute the attack you speak of. By a sudden jerk he finally succeeds in bringing the leg forward when the stifle bone slips back into its natural position, after which the excitement gradually subsides. He will then appear perfectly normal until the dislocation occurs again.

To then restore the dislocated bone

To then restore the dislocated bone to its proper position, pressure should be applied to the outside of the joint, pushing the bone forwards and inwards and at the same time pulling the lower part of the limb forward.

Your foal should be kept at rest as much as possible until the tone of the muscles and ligaments is restored.

Counter irritation to the joint by the application of a mild blister over a considerable surface around the stifle, will work and the stifle of the strength and the strength and the work. greatly aid in strengthening the weak-ened ligaments and muscles. If neces-sary the blister may be repeated after the hair grows again.—W. A. Shoults,

Keep the Cow

The cow is an income producer. She brings in her harvest continually. At times it may seem hard to scrape up enough feed, but it can usually be done. In addition to the milk and calf, the cow returns most of the plant food in her food in the manure. This means that the cow will help keep up the land, thus making the land more productive through manuring. The pasture continthus making the land more productive through manuring. The pasture continually becomes more fertile and growing such crops as alfalfa, grasses and cornputs the land in better shape for growing crops. Even if the cow does not make much profit she makes the acres that support her more productive, which usually means more profit.—Extension Division, North Dakota Agricultural College.

Give Sheep Plenty of Fresh Water

Sheep should not be compelled to drink from a muddy, scummy pond. Such water is liable to be contaminated with most kinds of diseases and parasites, to many of which sheep are susceptible. Sheep are clean animals and do best when treated as such. Clean, fresh water should be supplied in abundance.—P. K. Heerwagen, State Agricultural College, Fort Collins, Colorado.
