

ICE FORMATION.—The ice formation presented in the above is reproduced here because of its unusual character. It is rare, even in the history of Niagara, that such a formation can be found. In the above the visitor in imagination can wander through the aisles and transepts of a great cathedral whose music is the anthem of the waters and whose organ peal the unending thunder of the cataract.

AMERICAN FALL FROM BELOW—WINTER—Niagara Falls in winter is as great an attraction as Niagara Falls in summer. In the above picture, at the base of the Falls are piled up great masses of ice and snow which take the shapes of turrets and castles, of domes, spires and minarets. The formations are caused by the constant falling and freezing of the mists, that never for one instant of time are absent from the Falls.
