DANDELION CONTROL

Four or Five Sprayings With Iron Sulphate Will Do the Trick.

Little attention was paid to the dandelion as a weed thirty years ago, but with the clearing up of lands and removal of obstacles to the spread of the weed great increase of the nuisance is seen in grass land everywhere. The dandelion cannot succeed on land that is well cultivated, but areas of grass, whether pasture fields, roadways or lawns, are usually heavily infested. Large areas cannot well be treated unless the use of the land is such as to permit heavy expenditures. Small areas, such as lawns and portions of golf courses, may under proper management be kept free of dandelions.

Spraying with iron sulphate, four or five applications during one season, will generally free a grass area of the pest. But the treatment must be repeated every third year. The first spraying should be applied just before the first blooming period of the dandelion and followed by two others at intervals of three weeks. Two further applications should also be given during September or October. Spraying should not be done during the hot, dry period unless water can be applied to keep the grass growing vigorously. Grass areas that are sprayed usually blacken considerably after each application, but this burned appearance disappears after a few days. Areas that are being sprayed for the eradication of dandelion should be well fertilized, and grass seed should be applied to keep up the required number of grass plants to form a good turf. White clover is killed by iron sulphate spray, so cannot succeed under this method of dandelion control. The strength of solution to use is 1½ pounds to one gallon of water. —L. Stevenson, Secretary Dept. of Agriculture, Toronto.

Why a \$5,000 Bull Was Sold for \$50.

When a certain farmer a few years ago sold his registered Holstein bull to his local butcher no records had been made by any of the bull's daughters. Within a year eleven of the daughters freshened at the ages of two and three. Records were made of milk and butter-fat production, and to the astonishment of everybody the average milk production was 14,502 pounds and the average butter-fat production was 573 pounds.

But before these records were available the bull was dead and his hide had become leather. Because there were no records, a \$5,000 bull had been sold for \$50.
