

to Canada and largely profitable. It has been found that growing of  
 the potato involves considerable labor and financial investment. The  
 number in the plant in the field, which sometimes extends 15 to 20  
 feet into the soil, some of which are killed by frost and have  
 to be removed as rubbish. The gathering of the seeds  
 presents another problem, since the seeds do not all ripen at the same  
 time, and constant vigil would have to be kept over the fields  
 during the period of flowering, which usually continues for about six  
 weeks.

On the other hand, the rubber of the milch tree is found in the  
 leaves, and the seeds are in pods. Some care of course should be  
 taken for the harvesting of this plant. In addition, the seeds  
 might be used in the production of oil, and the waste product a  
 valuable material which can be used for dyes or other purposes. The  
 rubber of wood pulp is also a valuable product. The rubber of the  
 tree is an excellent substitute for paper, and is now almost entirely  
 used in the manufacture of paper. The rubber of the tree is also used  
 in the manufacture of other products.
