

Kerosene Gives More Power Than Gasoline

It is a proven scientific fact that kerosene gives off more heat units (power) than gasoline when it is properly used. The proper construction of an engine for developing power from kerosene is to connect the carburetor as close as possible to the cylinders, and heating the vaporized fuel with the exhaust.

Notice in the illustration on the left the short distance from carburetor to cylinder, this means perfect combustion and greatest power; while the illustration on the right shows a connection, often used, which is so long that it is impossible to draw the charge into the cylinder in its vaporized form, consequently less power is produced.

THE WATERLOO BOY ONE-MAN KEROSENE TRACTOR is built on the one correct principle for successful operation on kerosene fuel—twin cylinders cast en bloc connected to carburetor through a short manifold. The incoming charge is conveyed to the cylinder in a jacket cast around the exhaust which thoroughly heats and vaporizes the mixture of kerosene and air, it deposits the mixture still vaporized in the cylinder, thus producing all the power possible to get from the fuel.

Don't Be Fooled Into Buying a Tractor That Will Not Burn Kerosene Successfully

The heart of a tractor is its engine and if the engine is not constructed scientifically from a power producing point of view, you are not getting your full money's worth out of it. Let us tell you

more reasons why you should choose a Waterloo Boy Tractor to get full tractor efficiency.

Waterloo Boy Kerosene Tractor of Canada, Ltd.
