The Silo In Western Canada

On a Western Cattle Ranch.

To raise two head of cattle where only one could otherwise be raised—that is what thousands of farmers all over the American continent have been able to do with the help of silos. It is no wonder, then, that as the land in Western Canada is becoming more settled, silos should be making their appearance in greater and greater numbers there. Already in Manitoba many farmers are beginning to look upon the silo as a necessary part of the farm, and more than a hundred of them are in use in various parts of the province. Saskatchewan and Alberta, together, have probably about half the number as Manitoba, and the number in all the provinces is being slowly but surely added to every year.

With plenty of unoccupied prairie land growing an abundance of nutritious grasses the cattle feed problem in Western Canada has not been a really difficult one in the past. During the summer months the stock could forage over a large section of the country and there was no need for the owner to compute how many acres would support a cow. The obtaining of winter feed was just a matter of energy—a man could have as much hay as he could cut, free for the cutting. With such conditions as these, and they still prevail in many parts of the country, the need for silos has not been greatly felt up to now.

But the days of free range are drawing to a close. Already there are parts of the country where little or none is to be had. And as the country is getting more and more settled, and, moreover, as a system of mixed farming is becoming the rule throughout every province, even in those parts where for many years straight grain growing was practised, the need for some additional means of ensuring a steady supply of feed all the year round is beginning to make itself felt in various parts of Western Canada.

Silos will, therefore, continue to spring up throughout the country. Near Lacombe, Alberta, a ranching company, which has made a great reputation for the quality of beef it produces, is contemplating the erection of four new silos this year. This company has found with the silos it has in use that it can maintain double the number of cattle hitherto supported on the same area of land. Many smaller farmers are having the same experience. It is, as one farmer aptly expressed it, "like getting another farm for nothing." In times not long past it was not difficult to get a farm "for nothing" or "next to nothing" almost anywhere in Western Canada, and although land is still very cheap compared with its productive capacity, it is not always easy for a farmer in older settled districts to expand, and the only thing for him to do to increase his production, and thus his prosperity, is to intensify his methods. That this is being reached in some districts is a good sign for the future development of the country.

In the large irrigated area in Southern Alberta east of the growing city of Calgary, there is on foot a movement that may eventually lead to the establishment of silos on most of the farms in this territory. It is a country admirably suited for dairying and other

One of the Recently Built Albertan Silos.

branches of the livestock industry, capable of producing sufficient food for the support of hundreds of thousands of horses, cattle, sheep or swine. Most of the farms are for Western Canada, on the small side, generally from 80 to 320 acres each. But the soil is wonderfully fertile, and with an assured supply of moisture made possible by irrigation, will grow abundant crops of grain and fodders, including wheat, oats, barley, alfalfa, various kinds of grasses and clovers, and also roots and vegetables. For ensilage purposes, corn, sunflowers, alfalfa, peas, oats, and many other crops can be grown. In years to come this part of Alberta will be one of the greatest food producing areas in the world.

What crops are used for ensilage purposes in Western Canada? In Manitoba corn is mostly used, but in Alberta peas and oats are most popular. Other crops used are sudan grass, millets, rape, buckwheat and alfalfa. Sunflower is also being tried, but at present it is only in the experimental stage. The success with which peas and oats are grown, the enormous yields and high feeding value of the mixture, together with its succulence, palatability and flavour, account for its popularity and it will always maintain a leading place with the farmers of the most westerly of the Prairie Provinces, no matter what strides may be made in the growth of suitable varieties of corn.

Silos are coming to stay in Western Canada. Their appearance in slowly increasing numbers is a landmark in the development of the country. As they increase in numbers the prosperity of the country will grow, and as one far-sighted man has put it, "Western Canada will then not only be the granary of the world, but a universal provisioner as well."
