## Air Mixing Necessary at Gas Burner Tip

Forecasts—Northwest gales Friday, northwest winds, fair and cold.

The combustible constituents of natural gas are made up of combinations of the elements carbon and hydrogen. When natural gas is burned so as to secure perfect combustion only carbon dioxide and water vapor are formed; that is, the carbon of the gas unites with the oxygen of the air forming carbon dioxide, and the hydrogen of the gas unites with the oxygen of the air forming water vapor. The water vapor, of course, will condense when cooled. This water vapor does not come from the gas, but is created and formed by the chemical action of the hydrogen in the gas and the oxygen in the air.

Each cubic foot of natural gas burned requires approximately 9 1/2 cubic feet of air, forming 10 1/2 cubic feet of combustion products, which are made up of 2 cubic feet of steam, 1 cubic foot of carbon dioxide and 7 1/2 cubic feet of nitrogen, all thoroughly diffused through each other.

ALTHOUGH NATURAL GAS IS CHEAP, DO NOT WASTE IT—THE SUPPLY IS NOT EVERLASTING.
